WARNING

California Proposition 65
This engine contains or exhaust chemicals known to the state of California to cause cancer, birth defects or other reproductive harm.
YOUR TOHATSU OUTBOARD MOTOR

To You, Our Customer

Thank you for selecting a TOHATSU outboard motor. You are now the proud owner of an excellent outboard motor that will service you for many years to come. This manual should be read in its entirety and the inspection and maintenance procedures described later in this manual should be followed carefully. Should a problem arise with the outboard motor, please follow the troubleshooting procedures listed at the end of this manual. If the problem persists, contact an authorized TOHATSU service shop or dealer. Please always keep this manual together with the outboard motor as a reference to everyone who uses the outboard motor. If the outboard motor is resold, make sure the manual is passed on to the next owner.

We hope you will enjoy your outboard motor and wish you good luck in your boating adventures.

TOHATSU CORPORATION

OWNER REGISTRATION AND IDENTIFICATION

Upon purchasing this product, be sure that the WARRANTY CARD is correctly and completely filled out and mailed to the addressee noted there on. This WARRANTY CARD identifies you as the legal owner of the product and serves as your warranty registration. TO THE EXTENT PERMITTED BY APPLICABLE LAW, YOUR OUTBOARD MOTOR WILL NOT BE COVERED BY THE APPLICABLE LIMITED WARRANTY, IF THIS PROCEDURE IS NOT FOLLOWED.

PRE-DELIVERY CHECK

Be sure that the product has been checked by an authorized TOHATSU dealer before you take delivery.
Serial Number
In the space below, please record the outboard motor’s serial number (indicated both on the swivel bracket and on the cylinder block). The serial number will be needed when ordering parts, and when making technical or warranty inquiries.

Serial Number:
NOTICE: DANGER/WARNING/CAUTION/Note

Before installing, operating or otherwise handling your outboard motor, be sure to thoroughly read and understand this Owner’s Manual and carefully follow all of the instructions. Of particular importance is information preceded by the words “DANGER,” “WARNING,” “CAUTION,” and “Note.” Always pay special attention to such information to ensure safe operation of the outboard motor at all times.

DANGER

Failure to observe will result in severe personal injury or death, and possibly property damage.

WARNING

Failure to observe could result in severe personal injury or death, or property damage.

CAUTION

Failure to observe could result in personal injury or property damage.

Note

This instruction provides special information to facilitate the use or maintenance of the outboard motor or to clarify important points.

GENERAL SAFETY INFORMATION

SAFE OPERATION OF BOAT
As the operator/driver of the boat, you are responsible for the safety of those aboard and those in other boat around yours, and for following local boating regulations. You should be thoroughly knowledgeable on how to correctly operate the boat, outboard motor, and accessories. To learn about the correct operation and maintenance of the outboard motor, please read through this manual carefully.

It is very difficult for a person standing or floating in the water to take evasive action should he or she see a power boat heading in his/her direction, even at a slow speed. Therefore, when your boat is in the immediate vicinity of people in the water, the outboard motor should be shifted to neutral and shut off.

WARNING
SERIOUS INJURY IS LIKELY IF A PERSON IN THE WATER MAKES CONTACT WITH A MOVING BOAT, GEAR HOUSING, PROPELLER, OR ANY SOLID DEVICE RIGIDLY ATTACHED TO A BOAT OR GEAR HOUSING.

EMERGENCY STOP SWITCH
The Emergency Stop Switch will stall the outboard motor when the stop switch lanyard is pulled off. This stop switch lanyard has to be attached to the operator of the outboard motor to minimize or prevent injuries from the propeller in case the operator falls overboard.

It is operator’s responsibility to use the Emergency Stop Switch Lanyard.

WARNING
Accidental activation of the Emergency Stop Switch (such as the tether being pulled out in heavy seas) could cause passengers to lose their balance and even fall overboard, or it could result in loss of power in heavy seas, strong currents, or high winds. Loss of control while mooring is another potential hazard.
To minimize accidental activation of the Emergency Stop Switch, the 500 mm (20 inch.) stop switch lanyard is coiled and can extended to a full 1300 mm (51 inch.).

PERSONAL FLOATATION DEVICE
As the operator/driver and passenger of the boat, you are responsible to wear a PFD (Personal Floatation Device) while on the boat.
SERVICING, REPLACEMENT PARTS & LUBRICANTS
We recommend that only an authorized service shop perform service or maintenance on this outboard motor. Be sure to use genuine parts, genuine lubricants, or recommended lubricants.

MAINTENANCE
As the owner of this outboard motor, you should be acquainted with correct maintenance procedures following maintenance section of this manual (See page 61). It is the operator’s responsibility to perform all safety checks and to ensure that all lubrication and maintenance instructions are complied with for safe operation. Please comply with all instructions concerning lubrication and maintenance. You should take the engine to an authorized dealer or service shop for periodic inspection at the prescribed intervals. Correct periodic maintenance and proper care of this outboard motor will reduce the chance of problems and limit overall operating expenses.

Carbon Monoxide Poisoning Hazard
Exhaust gas contains carbon monoxide, a colorless and odorless gas which can be fatal if inhaled for any length of time. Never start or operate the engine indoors or in any space which is not well ventilated.

Gasoline
Gasoline and its vapors are very flammable and can be explosive. Use extreme care when handling gasoline. You should be thoroughly knowledgeable on how to correctly handle gasoline by reading this manual.

EPA Emissions Regulations
Outboards sold by Tohatsu America Corporation in the United States are certified to the United States Environmental Protection Agency as conforming to the requirements of the regulations for the control of air pollution from new outboard engines. This certification is contingent on certain adjustments being set to factory standards. For this reason, the factory procedure for servicing the product must be strictly followed and, wherever practicable, returned to the original intent of the design. Maintenance, replacement, or repair of the emission control devices and systems may be performed by any marine engine repair establishment or individual.

Engines are labeled with an Emission Control Information decal as permanent evidence of EPA certification.

Emissions Warranty Coverage

WARRANTY INFORMATION

Four Stroke Outboard Limited Warranty
Canadian and California residents who have purchased an outboard motor from a Canadian and California dealer receive additional warranty coverage for specific emissions related components. To fully understand your warranty coverage please read our standard warranty statement and the Emission Warranty Statement provided by your dealer.
1. Mounting the outboard motor on boat

**WARNING**

Before installing the outboard motor on the boat, hang the outboard motor with the hoist or equivalent device by attaching the engine hanger to the outboard. Use the hoist with allowable load is 150 kg (330 lbs) or above.

**WARNING**

Most boats are rated and certified in terms of their maximum allowable horsepower, as shown on the boat’s certification plate. Do not equip your boat with an outboard motor that exceeds this limit. If in doubt, contact your dealer. Do not operate the outboard motor until it has been securely mounted on the boat in accordance with the instructions below.

**WARNING**

- Mounting the outboard motor without following this manual can lead to unsafe conditions such as poor maneuverability, lack of control or fire.
- Loose clamp screws and/or mounting bolts can lead to the release or displacement of the outboard motor, possibly resulting in loss of control and/or serious personal injury. Be sure that fasteners are tightened to the specified torque (30 Nm (3.0 kgf) 13 ft-lb). Check the fasteners for tightness from time to time.
- Be sure to use outboard mounting fasteners included in the outboard motor package or their equivalents in terms of size, material, quality and strength. Tighten fasteners to the specified torque (30 Nm (3.0 kgf) 13 ft-lb). Test cruise to check if fasteners are tightened securely.
- Outboard motor mounting must be performed by trained service person(s) using lift or hoist with sufficient capacity.

Outboard motor mounting must be performed by trained service person(s) using lift or hoist with sufficient capacity.
Position ... Above keel line
Set engine at center of boat.

1. Center of boat
2. Boat transom

Transom matching
Be sure that the anti ventilation plate of the outboard motor is 5–25 mm (0.2–1 in) below the bottom of hull.
If the above condition cannot be met due to the shape of the bottom of your boat, please consult your authorized dealer.

1. Bottom of hull
2. Anti ventilation plate

Before beginning the running test, check that the boat with maximum capacity loading floats on the water in a proper attitude. Check the position of water surface on the driveshaft housing. If the water surface is near the bottom cowling, in high waves, water may enter the engine cylinders.

Incorrect outboard motor mounting height or existence of underwater object(s), such as hull bottom design, bottom surface conditions or underwater accessories, can cause water spray possibly reaching the engine through an opening of the bottom cowling during cruising. Exposing the engine to such conditions for extended periods can lead to severe engine damage.

Mounting bolts

Manual tilt type
1. To attach the outboard motor to the boat, tighten the clamp screws by turning their handles.
   Also, use the bolts to secure the outboard motor brackets on transom board.
   Secure the outboard motor with a rope to prevent loss overboard.

Note
A rope is not included in the standard accessories.
PTT type
1. To attach the outboard motor to the boat, use the bolts to secure the outboard motor brackets on transom board.

![View A](ENOF00017-A)

1. Bolt (12 x 105)
2. Washer (small diameter)
3. Nut
4. Washer (large diameter)

![View A](ENOF00017-A)

**CAUTION**
- Mounting bolts should be installed with the bolt head at inside surface of the transom. Mounting bolts installed with the threaded end at the inside surface of the transom can cause personal injury.
- Tighten the bolts sufficiently, otherwise falling down of outboard could be happened.

**Notes**
1. Apply sealing agent, such as silicone sealed between the bolts and the transom board holes before tightening the bolts.
2. Be sure to tighten the mounting bolt nuts to the specified torque.
   (30 Nm (3.0 kgf) 13 ft-lb)

**2. Remote control device installation**

**Remote control box location**

![Remote control box location](ENOF00840-0)

1. Shift cable
2. Throttle cable
3. Cable harness B

Install the remote control box in a position where it is easy to reach and operate the controls.
Make sure there are no obstacles that can interfere with the operation of the remote control cable.

Be careful not to loop the remote control cables to a diameter of 406 mm (16 inches) or less. Otherwise, it affects the service life of the cable.

Measure the distance from the remote control box to the outboard motor where the remote control cable should be routed. Prepare a cable that is 300-450mm (11.8-17.7in) longer than the measured distance. Temporarily pull the cable along the intended cable route to check its length is sufficient.

Connect the remote control cable to the engine, then run the cable to the remote control box, making sure it is not sharply bent, too taut and free from obstructions that could interfere with steering.

Battery electrolyte contains sulfuric acid and thus is hazardous, causing a burn if it comes in contact with your skin, or poisonous if swallowed. Keep battery and electrolyte away from reach of children. When handling the battery, be sure to:
- Read all warnings shown on the battery case
- Prevent electrolyte from coming in contact with any part of your body. Contact can cause serious burn or, if it comes in contact with your eye, loss of sight. Use safety glasses and rubber gloves.

In case battery electrolyte comes in contact with:
- Skin, flush thoroughly with water.
- Eye, flush thoroughly with water, and then seek immediate medical treatment.

In case battery electrolyte is swallowed:
- Seek immediate medical treatment.

Battery generates explosive hydrogen gas. Be sure to:
- Charge the battery in a well-ventilated place.
- Place the battery away from any source of fire, sparks and open flames such as burners or welding equipment.
- Do not smoke near the battery when the battery is charging.
- Do not charge the battery when the electrolyte level is low. Otherwise, the battery will be damaged and may cause malfunction.

**CAUTION**

- Make sure that the battery leads do not get stuck between the outboard motor and boat when turning, etc.
- The starter motor may fail to operate if the leads are incorrectly connected.
- Be sure to correctly connect the (+) and (−) leads. If not, the charging system will be damaged.
- Do not disconnect the battery leads from battery while the engine is operating, the electrical parts could be damaged.
- Always use a fully charged battery.

**CAUTION**

Do not use a battery that is not recommended. Use of a battery not recommended can lead to poor performance of, and/or damage to, the electrical system.

---

**Note**

Recommended battery: 12V 70AH/5HR, 650 (Cold Cranking Amps (CCA)). In case of cold weather: 12V100AH/5HR (850CCA)

Specifications and features of batteries vary among the manufacturers. Consult the manufacturer for details.

* The battery should be purchased separately and is not supplied with the outboard motor.

1. Place the battery box in a convenient position away from possible water spray. Securely fasten both the box and the battery so they do not shake loose.

2. Connect the positive lead (+) to the positive terminal (+) of the battery, and then connect the negative lead (−). When disconnecting the battery always remove the negative lead (−) first. After connecting the positive terminal (+), securely place a cap on it to prevent short circuits.

---

1. Battery cord (red)
2. Battery cord (black)

**4. TOCS (Tohatsu Onboard Communication System) installation**

TOCS (Tohatsu Onboard Communication System) interface coupler can provide information regarding engine speed, fuel consumption, and various malfunction via an optional interface cable. Contact authorized Tohatsu dealer for more detail.
### 1. Fuel handling

**CAUTION**

Use of improper gasoline can damage your engine. Engine damage resulting from the use of improper gasoline is considered misuse of the engine, and damage caused thereby will not be covered under the limited warranty.

**FUEL RATING**

TOHATSU engines will operate satisfactorily when using a major brand of unleaded gasoline meeting the following specifications:

**USA and Canada** — having a posted pump Octane Rating of 87 (R+M)/2 minimum. Premium gasoline (92 [(R+M)/2 Octane]) is also acceptable. Do not use leaded gasoline.

**Outside USA and Canada** — Use unleaded gasoline with declared octane rating of 91 RON or over. Use of premium gasoline of 98 RON is also allowed.

**GASOLINES CONTAINING ALCOHOL**

The fuel system components on your TOHATSU engine will withstand up to 10% ethyl alcohol (hereinafter referred to as the "ethanol"), content in the gasoline. But even if the gasoline in your area contains ethanol less than 10%, you should be aware of certain adverse effects that can occur. Increasing the percentage of ethanol in the fuel can also worsen these adverse effects. Some of these adverse effects are caused because the ethanol in the gasoline can absorb moisture from the air, resulting in a separation of the water/ethanol from the gasoline in the fuel tank. These may cause increased:

- Corrosion of metal parts
- Deterioration of rubber or plastic parts
- Fuel permeation through rubber fuel lines
- Starting and operating difficulties

If the use of gasoline containing alcohol is inevitable, or presence of alcohol is suspected in the gasoline, it is recommended to add a filter that has water separating capability, and check the fuel system for leaks and mechanical parts for corrosion and abnormal wear more frequently. And, in case any of such abnormality is found, discontinue the use of such gasoline and contact our dealer immediately.

If the outboard motor will only be used infrequently, please see the remarks on fuel deterioration in the STORAGE chapter (P 79) for additional information.

**CAUTION**

When operating a TOHATSU engine on gasoline containing alcohol, storage of gasoline in the fuel tank for long periods should be avoided. Long periods of storage, create unique problems. In cars, alcohol blend fuels normally are consumed before they can absorb enough moisture to cause trouble, but boats often sit idle long enough for phase separation to take place. In addition, internal corrosion may take place during storage if alcohol has washed
protective oil films from internal components.

---

**WARNING**

Fuel leakage can cause fire or explosion, potentially leading to severe injury or loss of life. Every fuel system part should be checked periodically, and especially after long term storage, for fuel leak, change of hardness of rubber, expansion and/or corrosion of metals. In case any indication of fuel leakage or degradation of fuel part is found, replace relevant part immediately before continuing operation.

---

2. Fuel filling

---

**WARNING**

Do not fill the fuel tank over capacity. The rise of gasoline temperature may cause gasoline to expand which, may leak through air vent screw when it is open. Leaking gasoline is a dangerous fire hazard.

---

**WARNING**

Consult an authorized dealer for details on handling gasoline, if necessary.

Gasoline and its vapors are very flammable and can be explosive.

When carrying a fuel tank containing gasoline:

- Close the fuel tank cap and air vent screw of fuel tank cap, or gasoline vapor will be emitted through the air vent screw, creating a fire hazard.
- Do not smoke.

When or before refueling:

- Be sure to remove the static electricity charged in your body before refueling.
- The sparks due to static electricity may cause explosion of flammable gasoline.
- Stop the engine, and do not start the engine during refueling.
- Do not smoke.
- Be careful not to overfill fuel tank. Wipe up any spilled gasoline immediately.

When or before cleaning the gasoline tank:

- Dismount fuel tank from the boat.
- Place the fuel tank away from every source of ignition, such as sparks or open flames.
- Do the work outdoors or in a well ventilated area.
- Wipe off gasoline well immediately if spilled.

After cleaning gasoline tank:

- Wipe off gasoline well immediately if spilled.
- If the fuel tank is disassembled for cleaning, reassemble carefully. Imperfect assembly may cause a fuel leak, possibly leading to fire or explosion.
- Dispose aged or contaminated gasoline in accordance with local regulations.

---

**WARNING**

When opening fuel tank cap, be sure to follow the procedure described below. Fuel could blast out through the fuel tank cap in case the cap is loosened by using another procedure when internal pressure of fuel tank is raised by heat from sources such as sun light.

1. Full open the air vent screw on the fuel tank cap and release internal pressure.
1. Air vent screw
2. Fuel tank cap

2. Loosen the tank cap until it contacts the tab lock and release internal pressure completely. After that, press down the tab lock and open the tank cap.
3. Fill the fuel carefully not to over flow.
4. After filling the tank, close the fuel tank cap until two clicks sound is heard.

3. Engine oil recommendation

The engine oil is drained for shipping from the factory. Be sure to fill the engine to the proper level before starting engine. (To properly fill the engine with oil follow the instructions, See page 68)

Use only high quality 4-stroke engine oil to insure performance and prolonged engine life.

The SAE oil viscosity 10W-30 or 10W-40 FC-W outboard motor engine oil is recommended.

You can also use oils that carry the API rating of SH, SJ, or SL. Select the appropriate viscosity, based on atmospheric temperature, from the chart below.

Use of engine oils that do not meet these requirements will result in reduced engine life, and other engine problems.
4. Break-In

Your new outboard motor and lower unit require break-in for the moving components according to the conditions described in the following time table. Please refer to ENGINE OPERATION section (See page 35) to learn how to correctly start and operate the outboard motor.

ENOW00024-A

⚠️ DANGER

Do not operate the outboard motor in closed area or area with no forced ventilation.

Exhaust gas emitted by this outboard motor contains carbon monoxide that will cause death if inhaled continuously. Inhaling the gas initially causes symptoms such as feeling of sickness, drowsiness and headache.

During operation of the outboard motor:
- Keep peripheral area well ventilated.
- Always attempt to stay on the windward side of emission.

ENOW00023-1

⚠️ CAUTION

Operating the outboard motor without break-in can shorten service life. If any abnormality is experienced during the break-in:
- Discontinue the operation immediately.
- Have the dealer check the product and take proper action(s) if necessary.

ENON00008-0

Note

Proper break-in allows outboard motor to deliver it full performance for longer service life.

</table>
5. Warning system

If outboard motor encounters an abnormal condition of fault, the warning horn will emit a continuous beep or intermittent short beeps and the warning lamp (LED) will synchronize with the horn and engine speed will be limited (engine will not be stopped).

See next page for conditions which will lead to an abnormal condition or fault.

Location of warning horn and lamp

- **Warning horn**
  - RC model: Located inside the remote control.
  - Multi-Function tiller handle model: Located in the tiller handle.
  - Tiller handle model: Located in the engine cover.

- **Warning lamp (LED)**
  - RC model: Located in the tachometer & bottom cowl.
  - Multi-Function tiller handle & Tiller handle models: Located on the bottom cowl.

**Note**

Warning lamp for optional tachometer will synchronize with the warning lamp for engine side.

Remarks
*1: In this case, oil pressure switch is “ON”.
*2: It is necessary to stop the engine, if you want to stop the working indicators and re-set the warning system.

High speed ESG (Electronic Safety Governor)
High speed ESG is a device to prevent over revolution of the engine. If the load to the engine becomes light for some reason, it runs at a higher speed than the usual. In such the case, the buzzer sounds and the ESG is activated not to ignite the spark plug, therefore, the engine speed varies and be controlled under 6300rpm.

Low speed ESG
Low speed ESG is a device to prevent the engine from getting damage. If the engine has problems regarding cooling water, oil pressure, and sensors, the low speed ESG is activated not to ignite the spark plug, and disable fueling therefore, the engine speed varies and be controlled under 2800rpm.
Remedy
1. Reduce the throttle to less than half opening, and move to safe place quickly, and stop the engine.
   Check the propeller for bent or damaged blades.
   Consult an authorized dealer if engine shows the same result even after replacing propeller with new one.
2. Move to safe place quickly, and stop the engine.
   Check the engine oil level, and add engine oil if necessary.
   Consult your dealer if the engine oil level is too low or too high.
3. Move to safe place quickly, and check the discharge of cooling water from the water check port at idle speed and stop engine.
   Remove any foreign matter on the gear case and propeller if necessary. Consult an authorized dealer if no discharge of cooling water.
4. Consult an authorized dealer.

CAUTION
- Low speed ESG ON: Engine speed will be limited to 2800 rpm, however you should not continue to run engine.
- High speed ESG ON: Engine speed will be limited to 6300 rpm and engine will run rough until throttle is reduced.
Before starting

The engine oil is drained for shipping from the factory. Be sure to fill the engine to the proper level before starting engine. (To properly fill the engine with oil follow the instructions. See page 63)

Before starting engine for the first time after reassembling engine or off-season storage, disconnect stop switch lock and crank approximately 10 times in order to prime the oil pump.

1. Fuel feeding

When opening fuel tank cap, be sure to follow the procedure described below. Fuel could blast out through the fuel tank cap in case the cap is loosened by using another procedure when internal pressure of fuel tank is raised by heat from sources such as sun light.

When using EPA approval fuel tank, only use a primer bulb/hose assembly that has a Fuel Demand Valve (FDV) installed in the fuel hose or a sealing mechanism in the fuel connector as shown below. FDV and fuel connector that has an sealing mechanism prevent pressurized fuel spillage when the fuel connector is connected to the engine.

1. FDV in fuel hose
2. Sealing mechanism in fuel connector
3. Identification

Do NOT use a primer bulb/hose assembly that does not contain a Fuel Demand Valve or a sealing mechanism as shown below: otherwise fuel spillage may occur when the connector is connected to the engine.

Do not connect fuel connector except when operating engine. Fuel leakage is a fire or explosion hazard, which can cause serious injury or death.
1. Full open the air vent screw on the fuel tank cap.

2. Loosen the tank cap until it contacts the tab lock and release internal pressure completely. After that, close the tank cap until two clicks sound is heard.

3. Connect the fuel connector to the engine and fuel tank.

4. Squeeze primer bulb until it becomes stiff to feed fuel to vapor separator. Direct arrow mark upward when priming.

Do not squeeze primer bulb with engine running or when the outboard motor is tilted up. Otherwise, fuel could overflow.

2. Starting the engine

---

**CAUTION**

When the engine is started in the test tank, to avoid over heating and water pump damage, be sure the water level is at least 10 cm (4 in.) above the anti ventilation plate.

And be sure to remove the propeller, when starting the engine in the test tank. (See page 73)

Run the engine only at idling.
1. Over 10 cm (4 in.)

Be sure to stop engine immediately if cooling water check port is not discharging water, and check if cooling water intake is blocked. Operating engine could lead to overheating potentially leading to engine damage. Consult an authorized dealer if the cause cannot be found.

Do not keep turning starter motor for over 5 seconds, or the battery may be consumed, potentially making the engine starting impossible and/or damaging the starter.

If cranking over 5 seconds fails to start engine, return main switch to “ON”, and crank engine again after 10 seconds or more.

Do not try to crank after engine has started.

This model is provided with start in gear protection.

Note
Start-in-gear protection prevents engine from starting at other than neutral shift. In-gear starting of engine will move the boat immediately, potentially leading to falling down or causing passenger(s) to be thrown overboard.

**Tiller handle type**

1. Be sure to install the stop switch lock to the stop switch, and attach the stop switch lanyard securely to the operator or to the operator’s PFD (Personal Flotation Device.)

   1. Stop switch lock
   2. Set the control lever in the Neutral position.

   1. Shift lever
3. Set the throttle grip to START position.

1. Throttle grip

(For manual starter type)
This engine is equipped with a compression release mechanism.
4. Pull the starter handle slowly until you feel engagement, keep pulling till you feel less resistance. Then pull it quickly, repeat if necessary until started.

1. Slowly
2. Quickly
3. Starter handle

(For electrical starter type)
4. Push the starter switch button and release the button when the engine has started.

1. Starter Button

Multi-function tiller handle type
1. Be sure to install the stop switch lock to the stop switch, and attach the stop switch lanyard securely to the operator or to the operator’s PFD (Personal Flotation Device.)

1. Stop switch lock
2. Main switch key

2. Insert the main switch key.
3. Set the control lever in the Neutral position.

![Control Lever Diagram]

1. Shift lever

**CAUTION**

If the engine starts in gear, do not use it. Contact an authorized dealer.

4. Set the throttle grip to START position.

![Throttle Grip Diagram]

1. Throttle grip

5. Turn the main switch key to ON position and turn the main switch key to START position and release the key when the engine has started. The key returns to the original position, automatically.

![Main Switch Key Diagram]

1. Main switch key

**CAUTION**

Do not hold turning starter motor more than 5 seconds, or the battery may be consumed, potentially making the engine starting impossible and/or damaging the starter.

If cranking over 5 seconds fails to start engine, return main switch to “ON”, and crank engine again after 10 seconds or more.

6. Check the cooling water from cooling water check port.
Side mount RC type

1. Be sure to install the stop switch lock to the stop switch, and attach the stop switch lanyard securely to the operator or to the operator’s PFD (Personal Flotation Device.)

1. Stop switch lock

2. Insert the main switch key.

3. Set the control lever in the Neutral position. Do not raise the free throttle lever when starting the engine.

4. Turn the main switch key to ON position.

5. Turn the main switch key to START position and release the key when the engine has started. Also, confirm warning lamp light up with buzzer sound and then go off. The key returns to the original position, automatically.

Note

The free throttle lever can not be raised when the control lever shift is in Forward or Reverse.

6. Check the cooling water from cooling water check port.
Emergency starting

**WARNING**

When the emergency starter rope is used for starting engine;
- **Start in gear protection does not work.** Be sure to shift is at neutral position. Otherwise the engine will move the boat immediately and cause personal injury.
- **Be careful that your clothes or other items do not get caught in the rotating engine parts.**
- **To prevent accident and injury by rotating parts, do not re-attach flywheel cover and the top cowl after the engine has been started.**
- **Do not pull starter rope if any bystander is behind. The action can injure the bystander.**
- **Attach engine stop switch lanyard to clothing or any part of body like arm before starting engine.**

1. Remove the top cowl.
2. Remove starter lock cable from recoil starter by pulling the starter lock cable.
3. Remove the bolts (5pcs) and remove the recoil starter.
4. Insert the knotted end of the starter rope into the notch in the flywheel and wind the rope around the flywheel several turns clockwise.
5. Tie a loop in the another end of the emergency starter rope and attach socket wrench that is included in the tool kit.

6. Be sure to install the stop switch lock to the stop switch, and attach the stop switch lanyard securely to the operator or to the operator's PFD (Personal Flotation Device.)

7. Set the control lever in the Neutral position.

8. Pull the starter handle slowly until you feel engagement, keep pulling till you feel less resistance. Then pull it quickly.

9. After engine starts, do not reinstall fly-wheel cover and top cowl.

3. Warming up the engine

**CAUTION**

Be sure to check that cooling water is coming out of the cooling water check port during warm up.

Warm the engine at low engine speeds for about

- 3 minutes : above 41°F (5°C)
- 5 minutes at 2000 rpm : above 41°F (5°C)

This allows the lubricating oil to circulate to all parts of the engine. Operating the engine without warm up shortens the engine’s life.

**Engine speeds**

Idling speed after warming up.

Remark: In case of cold engine starting, idling speed is increased about 400 rpm for several minutes.
Trolling engine speed control function (except for normal tiller handle type)

If the main switch key is pressed for 1 (one) second during idling or trolling operation, engine revolution change.

Each time the main switch key is pressed in the above manner, engine speed changes as follows.

Starting
850 rpm → 950 rpm
950 rpm ← 1050 rpm

Buzzer short sounded one time, when set to 850 rpm engine speed, and tells the lowest engine speed was set.
Buzzer short sounded twice, when set to 1050 rpm engine speed, and tells the highest engine speed was set.
Reset the engine speed when after engine restarted and or engine speed is above 3,000 rpm, and then trolling engine speed to be 850 rpm as standard.
In addition, this function does not operate when battery voltage is lower than specified, set engine idle and trolling engine speed to 850 rpm automatically.
injury, and steering system and/or shifting mechanism may be damaged.

**WARNING**

Do not shift at high boat speed, or control may be lost, falling down or causing passenger(s) to be thrown overboard. Leading to serious personal injury.

**CAUTION**

Gear and clutch damage may occur if shifting at high engine speed. Engine must be in the slow idle position before shifting is attempted.

**CAUTION**

Idle speed may be higher during warming up of engine. If shifted to Forward or Reverse during warming up, it may be difficult to shift back to neutral. In such case, stop engine, shift to neutral, and restart engine to warm up.

**Note**

Frequent shifting to forward or reverse can accelerate wear or degradation of parts. In such case, replace gear oil earlier than the period specified.

**CAUTION**

Do not increase engine speed unnecessarily when the shift is in neutral and reverse, or engine damage may occur.
1. Shift lever

**Forward**
1. Turn the throttle grip to reduce engine speed.
2. When the engine reaches trolling (or idling) speed, quickly pull the shift lever to the Forward position.

**Reverse**
1. Turn the throttle grip to reduce engine speed.
2. When the engine reaches trolling (or idling) speed, quickly pull the shift lever to the Reverse position.

**Acceleration**

```
WARNING

Sudden acceleration and deceleration may cause passenger(s) to be thrown overboard or falling down.
```

Open throttle grip or control lever gradually.

---

1. Throttle grip

---

1. Forward (F)
2. Neutral (N)
3. Reverse (R)
4. Fully opened (Forward)
5. Full opened (Reverse)
6. Free throttle lever
7. Control lever
8. Lock button

---

**WARNING**

Sudden acceleration and deceleration may cause passenger(s) to be thrown overboard or falling down.
Forward
1. Quickly push the control lever to the Forward (F) position 32°, where the gear is connected, while lifting up on the lock button located under the control lever grip.
2. Further forward motion will open the throttle.

Reverse
1. Quickly pull the control lever to the Reverse (R) position at 32°, where the gear is connected, while lifting up on the lock button located under the control lever grip.
2. Further rearward motion will open the throttle.

Acceleration
Sudden acceleration and deceleration may cause passenger(s) to be thrown overboard or falling down.
Open throttle grip or control lever gradually.

5. Stopping the engine

WARNING
Be careful not to remove engine stop switch lanyard from engine accidentally while boat is running. Sudden stop of engine can cause loss of steering control. It can also cause loss of boat speed, possibly leading the crew(s) and or objects on the boat to be thrown forward due to inertial force.

Tiller handle type
1. Turn the throttle grip to the slow position.
2. Put the shift lever in the Neutral position.
Run the engine for 2-3 minutes at idling speed for cooling down if it has been running at full speed.
3. Push the stop switch for a few seconds to stop the engine.

3. Turn the main switch key to the OFF position or push the stop switch. (Do not forget to turn the key off).

Side mount RC type
1. Put the control lever in the Neutral position and run the engine for 2-3 minutes at idling speed for cooling down if it has been running at full speed.

2. Turn the main switch key to the OFF position or push the stop switch. (Do not forget to turn the key off).

1. Control lever
2. Main switch key

WARNING

After stopping the engine:
- Close the air vent screw on the fuel tank cap.
- Disconnect the fuel connector of the engine and the fuel tank.
- Disconnect the battery cord, after each use.
Emergency engine stopping
Remove stop switch lock to stop the engine.

1. Stop switch
2. Stop switch lock

ENOM00910-0
Spare emergency stop switch lock
A spare emergency stop switch lock is provided in the tool bag.
When used as described, the emergency stop switch clip and emergency stop switch lanyard system stops the engine if the operator falls away from the controls. When an operator falls into water, be sure to use emergency stop switch lock of the spare.
Be sure to confirm the spare stop switch lock is in the tool bag before begin to operate.

6. Steering

ENOW00870-0

⚠️ WARNING
Sudden steering may cause passenger(s) to be thrown overboard or falling down.

Tiller handle type
Right turn
Move the tiller handle to the left
Left turn
Move the tiller handle to the right.
Remote control type
Right turn
Turn the steering wheel to the right.
Left turn
Turn the steering wheel to the left.

**7. Trim angle**

**WARNING**

- Adjust the trim angle when the engine is stopped.
- Do not put hand or finger in between outboard motor body and clamp bracket when adjusting trim angle to prevent injury in case the outboard motor body falls.
- Unsuitable trim position can cause loss of control of boat. When testing a trim position, run boat slow initially to see if it can be controlled safely.

---

**WARNING**

Excessive trim up or down may lead to unstable boat operation, potentially causing the steering difficulty that leads to accident during cruising.

- Do not cruise at high speed if improper trim position is suspected. Stop the boat and readjust trim angle before continuing cruise.
- For outboard motor model with PTT switch on the bottom cowl, do not operate the switch during cruising, or control of boat may be lost.

The trim angle of the outboard motor can be adjusted to suit the transom angle of the hull, and load conditions. Choose an appropriate trim angle that will allow the anti-ventilation plate to run parallel to the water surface during operation.

**Proper trim angle**

The position of the thrust rod is correct if the hull is horizontal during operation.

1. Perpendicular to the water surface

**Improper trim angle (bow rises too high)**

Set the thrust rod lower if the bow of the...
boat rises above horizontal.

Improper trim angle (bow dips into the water)
Set the thrust rod higher if the bow of the boat is below horizontal.

Manual Tilt type

1. Thrust rod
2. Higher
3. Lower

Power Tilt type

1. Thrust rod
2. Higher
3. Lower

Trim angle adjustment (Manual tilt type)
The transom angle adjustment
1. Stop the engine.
2. Shift into neutral.
3. Raise the outboard motor to the tilt up position.
4. Change the thrust rod position as following picture.
5. Reinstall the thrust rod securely.
6. Gentry lower the outboard.
Trim angle adjustment (Power tilt type)
The transom angle adjustment
1. Stop the engine
2. Operate the Power Tilt switch and raise the outboard motor to the tilt up position.
3. Lock the tilt with the Tilt stopper.
4. Change the trim lock pin position as following picture.
5. Reinstall the thrust rod securely.
6. Operate the Power Tilt switch and lower the outboard.

1. Snap pin
2. Thrust rod

8. Tilt up and tilt down

WARNING
Do not tilt up or down outboard motor when swimmer(s) or passenger is near to prevent them from being caught between outboard motor body and clamp bracket in case the outboard motor body falls.

WARNING
When tilting up or down, be careful not to place your hand between the swivel bracket and the stern bracket. Be sure to tilt the outboard motor down slowly.

WARNING
When tilting up outboard motor with fuel joint for over a few minutes, be sure to disconnect fuel hose, or fuel may leak, potentially catching fire.

CAUTION
Do not tilt up outboard motor while engine operates, or no cooling water may be fed, leading to engine seizure due to overheating.

Note
Before tilting the outboard motor up, after stopping the motor leave it in the running position for about a minute to allow water to drain from inside the engine.

Manual Tilt type
Tilt up
Push the reverse lock lever down until it stops. (This is the tilt up position.) Now, tilt the outboard motor all the way up until it is locked in place.
1. Reverse lock lever
2. Tilt up position
3. Tilt down position

ENOM00063-B

**Tilt down**

Pull the reverse lock lever upward until it stops. (This is the tilt down position.) Now, lift up the outboard motor slightly, and then allow gravity to lower it for you.

ENOM00069-B

**Power Tilt type**

**Tilt up**

1. Operate the Power Tilt switch and tilt the outboard motor up.
2. Lock the tilt with the Tilt stopper after the outboard motor has been tilted up

**Tilt down**

1. Release the tilt stopper from the set-up position while slightly tilting up outboard motor.
2. Operate the Power Tilt switch and tilt the outboard motor down until the motor touches to the thrust rod.
1. Tilt stopper

The outboard motor can also be tilted up and down using the switch provided under the bottom cowl.

It is possible to tilt up or down in spite of main switch “ON” or “OFF”.

ENOM00840-0

**Manual relief valve**

If the battery is dead, and the power tilt switch thus inoperative, open the manual valve completely in the Manual direction. This will allow manual tilting of the outboard motor.

ENOW00872-0

---

**WARNING**

Make sure the manual relief valve is closed before operating the outboard motor. If the manual relief valve is not closed, the outboard motor will tilt up when operated in reverse.

ENOW00873-0

---

**WARNING**

Before opening the manual relief valve, make sure nobody is under the outboard motor. If the outboard motor is in the tilted up position, it will tilt down suddenly if the manual relief valve is loosened in the "Manual" direction.
9. Shallow water operation

**WARNING**

During shallow water operation, be careful not to place your hand between the swivel bracket and the clamp bracket. Be sure to tilt the outboard motor down slowly.

**CAUTION**

While in shallow water drive position, do not operate the outboard motor in Reverse. Operate the outboard motor at slow speed and keep the cooling water intake submerged.

**CAUTION**

Do not overtilt outboard motor when driving shallow water, or air may be sucked through water inlet and sub-water inlet, potentially leading to engine overheating.

---

**Manual tilt type**

1. Shallow water running position:
   Put the reverse lock lever in the tilt up position, and tilt up the outboard motor to put the outboard motor in the shallow water running position.

2. Return to normal running position:
   Put the reverse lock lever in the tilt down position, slightly lift up the outboard motor, and then put it down.

---

1. Water inlet
2. Sub-water inlet
Power Tilt type

1. Operate the Power Tilt switch and tilt the outboard motor up into desired shallow water running position.
1. Removing the outboard motor

**WARNING**

Before installing the outboard motor on the boat, hang the outboard motor with the hoist or equivalent device by attaching the engine hanger to the outboard. Use the hoist with allowable load is 150 kg (330 lbs) or above.

**CAUTION**

Engine may be hot immediately after operating and could cause burns if touched. Allow engine to cool down before attempting to carry the outboard.

1. Stop the engine.
2. Remove the top cowl.
3. Disconnect the fuel connector, the remote control cables and the battery cords from the outboard motor.
4. Attach the hoist hooks to the engine hanger.
5. Remove the outboard motor from boat and completely drain the water from the gear case.

---

2. Carrying the outboard motor

**WARNING**

Be sure to disconnect fuel connector except when operating engine. Fuel leakage is a fire or explosion hazard, which can cause serious injury or death.

**WARNING**

Close air vent screw of fuel tank before carrying or storing outboard motor and fuel tank, or fuel may leak, potentially catching fire.

**CAUTION**

- Do not give a shock to an outboard motor during transportation. It becomes a cause of breakage.
Do not carry or store outboard motor in any of positions described below. Otherwise, engine damage or property damage could result from leaking oil.

Keep the outboard motor in a vertical position when carrying. The optional outboard motor stand is recommended for keeping the outboard motor vertical both during transport and storage.

**Note**
- If the outboard motor must be laid down be sure drain the fuel and engine oil, then the port side faces down as shown in the drawing above.

Elevate power unit 2 inches to 4 inches if traveling to avoid oil spillage.

**3. Traillering**

**CAUTION**
Trailering in the tilted position may cause damage to the outboard motor, boat, etc.

**WARNING**
Be sure to disconnect fuel connector except when operating engine. Fuel leakage is a fire or explosion hazard, which can cause serious injury or death.

**WARNING**
Close air vent screw of fuel tank and fuel cock before carrying or storing outboard motor and fuel tank, or fuel may leak, potentially catching fire.
The tilt support device supplied on your outboard motor is not intended for towing. It is intended to support the outboard motor while the boat is docked, beached, etc.

When transporting a boat on a trailer with the outboard motor still attached, disconnect the fuel line from the outboard motor beforehand and keep the outboard motor in the normal running position or on a transom saver bar.

**Tiller handle type**
To prevent the outboard motor from moving when it is attached on a boat during transport on a trailer, properly tighten the steering friction lever (page 59).

1. Ground clearance should be provided sufficiently.
2. Transom saver bar

---

**CAUTION**

Do not go under outboard motor tilted up even if it is supported by support bar, or accidental fall of outboard motor could lead to severe personal injury.
1. **Steering friction**

**Tiller handle type**

ENOW00074-A

⚠️ **WARNING**

Do not overtighten the steering friction lever it could result in difficulty of movement resulting in the loss of control causing an accident and could lead to severe injury.

Adjust this lever to achieve the desired steering friction (drag) on the tiller handle. Move lever towards (A) to tighten friction and move lever towards (B) to loosen friction.

---

2. **Throttle grip friction**

ENOW00074-B

⚠️ **WARNING**

Do not overtighten the throttle adjustment screw or it could result in difficulty of movement resulting in the loss of control causing an accident and could lead to severe injury.

Friction adjustment of the throttle grip can be made with the throttle adjustment screw.

---

3. **Remote control lever friction**

ENOW00074-C

⚠️ **WARNING**

Do not overtighten the remote control throttle friction adjustment screw or it could result in difficulty of movement resulting in the loss of control causing an accident and could lead to severe injury.

To adjust the friction of the remote control lever, turn the throttle friction adjustment screw on the front of the remote control. Turn clockwise to increase the friction and...
counter-clockwise to decrease it.

**Side mount type**

![Diagram of throttle friction adjustment screw](image)

1. Throttle friction adjustment screw
2. Lighter
3. Heavier

---

**4. Trim tab adjustment**

**WARNING**

- Be sure that outboard motor is secured to transom or service stand, or accidental drop or fall of outboard motor could lead to severe personal injury.
- Be sure to lock outboard motor when it is tilted up, otherwise accidental fall of outboard motor could lead to severe personal injury.
- Do not go under outboard motor tilted up and locked, or accidental fall of outboard motor could lead to severe personal injury.

---

**Notes**

- After adjustment securely tighten the trim tab fixing bolt.
- Check for looseness of the bolt and the trim tab at regular intervals.

---

**WARNING**

Inappropriate adjustment of trim tab could cause steering difficulty. After installing or readjusting trim tab, check if steering load is even.
INSPECTION AND MAINTENANCE

Care of your outboard motor
To keep your outboard motor in the best operating condition, it is very important that you perform daily and periodic maintenance as suggested in the maintenance schedules that follow.

CAUTION

- Your personal safety and that of your passengers depends on how well you maintain your outboard motor. Carefully observe all of the inspection and maintenance procedures described in this section.
- The maintenance intervals shown in the checklist apply to an outboard motor in normal use. If you use your outboard motor under severe conditions such as frequent full-throttle operation, frequent operation in brackish water, or for commercial use, maintenance should be performed at shorter intervals. If in doubt, consult your dealer for advice.
- We strongly recommend that you use only genuine replacement parts on your outboard motor. Damage to your outboard motor arising from the use of other than genuine parts is not covered under the warranty.
### 1. Daily Inspection

Perform the following checks before and after use.

---

**WARNING**

Do not use outboard motor if any abnormality is found during pre-operation check otherwise it could result in severe damage to the motor or severe personal injury.

---

</table>
Oil level checking
If the oil level is low, or too high, the life of the engine will be shortened significantly.
1. Stop the engine and set it in a vertical position.
2. Remove the top cowl.
3. Remove the dipstick after 5 minutes engine has stopped.
4. Wipe oil off the oil dipstick with a clean rag.
5. Put in the dipstick.
6. Take out the dipstick and check the oil level.
7. Return the dipstick.

</tr>
</tbody>
</table>

**Note**
The oil level should be checked when the engine is cold.

**Note**
Consult with an authorized dealer if the engine oil is milky color, or appears contaminated.

Engine oil replenishing

- Do not add engine oil of brand and grade other than existing one. In case engine oil of other brand or grade is added, drain all oil and ask dealer for treatment.
- In case other than engine oil such as gasoline is put in the oil chamber, empty the chamber and ask dealer for treatment.
- When replenishing engine oil, be careful not to allow entry of foreign matters such as dust and water into oil chamber.
- Wipe off engine oil well immediately if spilled and dispose of it in accordance with local fire prevention and environment protection regulations.
- Do not replenish engine oil over upper limit. If overfilled, remove oil to upper limit. If engine oil is over the upper limit, it can leak potentially leading to engine damage.

If the oil level is low, or at lowest mark, add recommended oil to the middle dipstick mark.

ENOW00920-0

⚠️ CAUTION

When washing the outboard motor, be careful not to spray the water inside of the top cowl, especially electrical components.

ENON00026-0

Note

It is recommended to check chemical properties of water on which your outboard motor is regularly used.

If outboard motor is used in salt water, brackish water or water with a high acidic level, use fresh water to remove salt, chemicals or mud. And flush cooling water passage after every cruising or before storing outboard motor for long time. Before flushing, remove the propeller and the forward thrust holder.

ENOW00921-0

Flushing attachment

ENOW00922-0

⚠️ CAUTION

Do not operate the engine when flushing the outboard motor with a flushing attachment as this can cause damage to the outboard motor.

ENOW00922-0

⚠️ CAUTION

To prevent the engine from starting when you are near the propeller, remove the stop switch lock.

1. Tilt down the outboard motor.
2. Remove the flushing connector cap from the outboard motor, and screw in the flushing attachment.
3. Connect a water hose. Turn on the water and adjust the flow.
Continue flushing the outboard motor for 3 to 5 minutes.
4. After the flushing, be sure to reattach the flushing connector cap.
5. Tilt up the outboard motor.

**WARNING**

Do not start engine without removing propeller, or accidentally turning propeller could cause personal injury.

**WARNING**

Never start or operate the engine indoors or in any space which is not well ventilated. Exhaust gas contains carbon monoxide, a colorless and odorless gas which can be fatal if inhaled for any length of time.

**CAUTION**

When the engine is started in the test tank, to avoid over heating and water pump damage, be sure the water level is at least 10 cm (4 in.) above the anti ventilation plate.
And be sure to remove the propeller, when starting the engine in the test tank. (See page 73)

1. Over 10 cm (4 in.)

**Fuse replacement**

Before replacing a fuse, disconnect the battery cable from the battery negative (-) terminal. Failure to do so may cause a short-circuit.

**CAUTION**

Never use a fuse with a rating that exceeds the specified rating as this could cause serious damage to the electrical system.

If a blown fuse is detected, try to determine the cause for this and correct it. If the cause for the problem is not corrected, the fuse will likely blow again.
If the fuse continues to blow, request an authorized Tohatsu dealer to inspect the outboard motor.
1. Stop the engine and disconnect the battery cable from the battery negative (-) terminal.
2. Remove the engine cover.
3. Remove the fuse box lid.
4. Remove the fuse and check it. If the fuse is blown, replace it with a fuse of the same specified rating. The outboard motor is supplied with spare fuses in the spare fuse holder.

1. Blown fuse
# 2. Periodic Inspection

It is important to inspect and maintain your outboard motor regularly. At each interval on the chart below, be sure to perform the indicated servicing. Maintenance intervals should be determined according to the number of hours or number of months, whichever comes first.

</table>
**Note**

Your outboard motor should receive careful, and complete inspection at 300 hours. This is the best time for major maintenance procedures to be carried out.

---

**Engine oil replacement**

**CAUTION**

You may be injured due to high engine temperatures if you fill engine oil just after stopping. Changing engine oil should be done after the engine has been cooled.

---

**CAUTION**

- Do not overfill engine oil, or engine oil could leak and/or engine could be damaged. If engine oil level is over upper limit marks of oil gauge, drain oil to level lower than upper limit.

- Be sure that outboard motor is in upright and level position when checking or changing oil.

- Stop engine immediately if low oil pressure warning lamp is lit or oil leak is found, or engine could be severely damaged. Consult dealer.

- Wipe off engine oil well immediately if spilled and dispose of it in accordance with local fire prevention and environment protection regulations.

---

**CAUTION**

Use of engine oils that do not meet these requirements will result in reduced engine life, and other engine problems.
Engine oil mixed with dust or water will dramatically shorten the life of the engine.

**To change engine oil:**

Be sure to use recommended engine oil (see page 13).

1. Stop the engine and allow it to cool.
2. Tilt up the outboard motor and lock the tilt with the tilt stopper.
3. Turn the steering on the outboard motor so that the drain hole is facing downward.
4. Put a oil drain pan under the oil drain screw.
5. Remove the oil drain screw and completely drain oil from the engine.

6. Tighten the oil drain screw with applying oil on the sealing surface of screw. (Use new oil drain washer)

Oil drain screw specified torque

**24Nm (17 ft-lb, 2.4 kgf-m)**

If a torque-wrench is not available when you are fitting a oil filter, a good estimate of the correct torque is 3/4 to 1 a turn past finger-tight. Have the oil filter adjusted to the correct torque as soon as possible with a torque-wrench.

7. Reset the engine in a vertical position.
8. Repeat 3 to 7 procedures two or three times to drain the oil completely.
9. Remove the top cowl and the oil filler cap.
10. Fill the engine through filler port with recommended oil (see chart below) to the middle of dipstick mark.
11. Tighten the oil filler cap.

---

**Note**

ENOF00028-A

ENOF01116-0

ENOF01121-A

ENOF00113-0
Use only recommended engine oil (See page 13)

Wipe off engine oil well immediately if spilled and dispose of it in accordance with local fire prevention and environment protection regulations.

Oil volume needed for complete oil replacement

<table>
<thead>
<tr>
<th>With oil filter replacement</th>
<th>Without oil filter replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>1800 mL (1.9 US qt.)</td>
<td>1600 mL (1.69 US qt.)</td>
</tr>
</tbody>
</table>

1. Drain oil from the engine.
2. Place a rag or towel below the oil filter to absorb any spilled oil.
3. Unscrew old filter by turning the filter to counter clockwise.
4. Clean the mounting base. Apply film of clean oil to O-ring.

Do not use grease.
Install oil filter and tighten it to specified torque by using oil filter wrench.

Oil filter torque: 18 Nm (13 ft-lb, 1.8 kgf-m)

If any amount of water is found in engine oil, making it milky white, consult dealer.
If engine oil is contaminated with fuel, emitting strong fuel smell, consult dealer.
Some oil dilution is normal if engine is idled or trolled for long periods, especially in cooler water temperatures.
1. Oil filter wrench
   P/N 3AC-99090-0
   P/N 3AC99090M
   (US. CANADA Only)

1. Oil filter
2. Fuel filter

Fuel filters are provided inside the fuel tank and engine.

ENOM00094-0
Fuel filter (for engine)
1. Check in the cup for water and debris.

2. If present, disconnect hoses from the fuel connector (male) and the fuel pump.
3. Remove the cup, filter and O-rings from the fuel filter body.
4. Check the wear and clogging for each parts, and replace if necessary.
5. Remove fuel and any water or debris from the cup, filter and hoses.
6. Reassemble all parts.

WARNING
Gasoline and its vapors are very flammable and can be explosive.
- Do not start this procedure while engine is operating or hot even after stopping it.
- Place fuel filter away from every source of ignition such as sparks or open flames.
- Wipe off gasoline well immediately if spilled and dispose of it in accordance with local fire prevention and environment protection regulations.
Fuel filter (for fuel tank)

Water or dirt in the fuel tank will cause engine performance problems. Check and clean the tank at specified times or after the outboard motor has been stored for a long period of time (over three months).

1. Remove the fuel pickup elbow of the fuel tank by turning it counterclockwise.
2. Clean the fuel filter and check the O-ring. Replace it if necessary.
3. Reassemble all parts.

Gear oil replacement

Be sure that outboard motor is secured to transom or service stand, or accidental drop or fall of outboard motor could lead to severe personal injury.

1. Tilt down the outboard motor.
2. Remove the oil plugs (lower and upper), and completely drain the gear oil into a pan.
3. Insert the oil tube nozzle into the lower oil plug hole, and fill with gear oil by squeezing the oil tube until oil flows out of the upper plug hole and bubbles is disappeared to remove the air.

Note

Use genuine gear oil or the recommended one (API GL-5: SAE #80 to #90). Required volume: approx. 360 mL (11.8 fl.Oz).
4. Install the upper oil plug, and then remove oil tube nozzle and install the lower oil plug.

**CAUTION**
Do not reuse oil plug gasket. Always use new gasket and tighten oil plug properly to prevent entry of water into lower unit.

Wipe off gear oil well immediately if spilled and dispose of it in accordance with local fire prevention and environment protection regulations.

**Note**
If water in the oil, giving it a milky colored appearance. Contact your dealer.

**Note**
Use genuine gear oil or the recommended one (API GL-5: SAE #80 to #90).
Required volume: approx. 360 mL (11.8 fl.Oz).

**WARNING**
- Do not begin propeller removal and installation procedure with spark plug caps attached, shift in forward or reverse, main switch at other than “OFF”, engine stop switch lock attached to the switch, and starter key attached, or engine could accidentally start leading to serious personal injury. Disconnect battery cable if possible.
- The propeller edge is thin and sharp. Wear the groves during replacement to protect your hands.

**CAUTION**
- Do not install propeller without thrust holder, or propeller boss could be damaged.
- Do not reuse split pin.
- After installing split pin, spread the pin apart to prevent it from falling out which could lead to the propeller coming off during operation.

A worn-out or bent propeller will lower the...
motor’s performance, and cause engine trouble.

1. Put a piece of wood block between propeller blade and anti-ventilation plate to hold propeller.

2. Remove the split pin, propeller nut and washer.

3. Remove the propeller and thrust holder.

4. Apply water proof grease to the propeller shaft before installing a new propeller.

5. Install the thrust holder, propeller, stopper, washer and propeller nut onto the shaft.

6. Tighten the propeller nut to specified torque, and align one of grooves to propeller shaft hole.

Propeller nut torque:

25 Nm (18 ft-lb, 2.5kgf-m)

7. Install a new split pin into the nut hole and bend it.

Propeller nut torque:

25 Nm (18 ft-lb, 2.5kgf-m)

1. Propeller
2. Thrust holder
3. Washer
4. Propeller nut
5. Split pin

WARNING

- Do not reuse spark plug with damaged insulation, or sparks can leak through crack, potentially leading to electric shock, explosion and/or fire.
- Do not touch spark plugs immediately after stopping engine as they will be hot and could cause severe burns if touched. Allow motor to cool down first.

CAUTION

Use only the recommended spark plugs. Spark plugs which have an different heat range may cause engine damage.

If the spark plug(s) is fouled, has carbon build up, or is worn, it should be replaced. When reusing spark plugs, remove dirt from the electrodes and adjust spark gap to specification.

1. Stop the engine.
2. Remove the top cowl.
3. Remove the spark plug caps.
4. Remove the spark plugs by turning it counter-clockwise, using a 5/8” (16 mm) socket wrench and handle that is provided in tool bag.
5. Inspect the spark plug. Replace the spark plug if the electrodes are worn or if the insulators are cracked or chipped.
6. Measure the spark plug electrode gap with a wire type feeler gauge. The gap should be 0.8-0.9 mm (0.031-0.035 inches). If the gap is different, replace the spark plug with a new one. Use spark plug NGK DCPR-6E.

- Electrode
- Spark gap (0.8–0.9 mm, 0.031–0.035 in)

7. Install the spark plug by hand and turn it carefully to avoid cross-threading.
8. Tighten the spark plug to the specified torque.

**Note**

- Spark plug torque: 18.0 Nm (13.3 ft-lb) [1.84 kgf-m]

If a torque-wrench is not available when you are fitting a spark plug, a good estimate of the correct torque is 1/4 to 1/2 a turn past finger-tight. Have the spark plug adjusted to the correct torque as soon as possible with a torque-wrench.
**Anode replacement**
A sacrificial anode protects the outboard motor from electrolytic corrosion. Anode is located on the gear case, cylinder etc.. When the anode is eroded more than 1/3 of original size, replace it.

**Notes**
- Never grease or paint the anode.
- At each inspection re-tighten the anode attaching bolt. As it is likely to be subjected to electrolytic corrosion.

*1 : Both side
*2 : Remove fuel filter to access the anode.
Power Tilt oil checking

**WARNING**
- Be sure that outboard motor is secured to transom or service stand, or accidental drop or fall of outboard motor could lead to severe personal injury.
- Be sure to lock outboard motor if it is tilted up, or accidental fall of outboard motor could lead to severe personal injury.
- Do not go under outboard motor tilted up and locked, or accidental fall of outboard motor could lead to severe personal injury.

**CAUTION**
Do not unscrew the oil cap with the outboard motor tilted down. Pressurized oil in the oil tank may spurt out.

Check the oil level in the reservoir tank while the tank is kept in a vertical position.
1. Tilt the outboard motor up and lock the tilt with the tilt stopper.
2. Remove the oil cap by turning counter clockwise, then check if the oil level reaches the bottom line of the plug hole.

**Recommended oil**
Use an automatic transmission fluid or equivalent. Recommended oils are as shown below.

**ATF Dexron III**

Air purging from the Power Trim and Tilt unit.
Entrained air in the Power Tilt unit will cause poor tilting movement and increased noise.
1. With the outboard motor mounted on the boat, set the manual release valve to the Manual side, and tilt the outboard motor manually up/down 5-6 times while checking the oil level.
2. When done, close the valve by turning it clockwise towards the Power side.
ENOM00960-0

**Grease point**

Apply water proof grease to the parts shown below.
3. Off-season storage

**WARNING**

- Be sure to disconnect fuel connector except when operating engine.
- Fuel leakage is a fire or explosion hazard, which can cause serious injury or death.

**WARNING**

Be sure to use cloth to remove fuel remaining in the cowl and dispose of it in accordance with local fire prevention and environment protection regulations.

**CAUTION**

Before servicing the motor for storage:
- Remove the battery cables.
- Remove the spark plug caps from the spark plugs.
- Do not run the motor out of the water.

Before you put your outboard motor in storage, it is a good opportunity to have it serviced and prepared by your dealer. Be sure to use fuel stabilizer while running the motor before storage. (See page 80)

2. Remove the fuel hose from the outboard motor.

3. Drain all fuel from the fuel hoses, fuel pump, fuel filter (See page 71) and vapor separator (See page 81), and clean these parts. Keep in mind that if gasoline is kept in the vapor separator for a long time, gum and varnish will develop, causing the float valve to stick, restricting the fuel flow.

4. Remove the spark plugs and put a teaspoon of engine oil or spray storage oil into the combustion chamber through the spark plug holes.

5. Turn the starter motor several turns to lubricate inside the cylinder.

6. Change the engine oil (See page 68).

7. Change the gear oil in the gear case (See page 68).

8. Apply grease to grease point (See page 78).

**Engine**

1. Wash the engine exterior and flush the cooling water system thoroughly with fresh water. Drain the water completely. Wipe off any surface water with an oily rag.
9. Stand the outboard motor up vertically in a dry place.

**CAUTION**

Do not carry or store outboard motor in any of positions described below. Otherwise, engine damage or property damage could result from leaking oil.

---

**Adding a fuel stabilizer**

When adding a fuel stabilizer additive (commercially available), first fill the fuel tank with fresh fuel. If the fuel tank is only partially filled, air in the tank can cause the fuel to deteriorate during storage.

1. Before adding fuel stabilizer additive, drain the vapor separator (See page 81).
2. Follow the instructions on the label when adding the fuel stabilizer additive.
3. After adding the additive, let the outboard motor run in the water for 10 minutes to make sure any old fuel in the fuel system has been completely replaced by the fuel with additive.
4. Turn the engine OFF

---

**Note**

If your motor is used occasionally, it is recommended to use a good fuel stabilizer in every tank of fuel and keep the container full to reduce condensation and evaporation.

---

- If the outboard motor must be laid down be sure drain the fuel and engine oil, then the outboard motor on a cushion as shown in the drawing below (See page 79 and 68).
- Elevate power unit 2 inches to 4 inches if traveling to avoid oil spillage.
Fuel system draining

**WARNING**

For details on handling fuel, contact an authorized dealer.

Fuel and fuel vapors are extremely flammable and can be explosive.
- If fuel is spilled, wipe it up immediately.
- Keep the fuel tank well away from sources of ignition, e.g. sparks or open flames
- Perform all work outdoors or in a well ventilated place.

**WARNING**

Be sure to use cloth to remove fuel remaining in the cowl and dispose of it in accordance with local fire prevention and environment protection regulations.

1. Disconnect the fuel hose from the outboard motor.
2. Remove the top cowl.
3. Release the drain tube from the clamp and pull the tube outside the bottom cowl. Place an approved fuel container under the drain tube end and use a funnel to avoid spilling fuel.
4. Loosen the vapor separator drain screw.
5. Tilt up the outboard motor until fuel flows out of the drain tube.
6. Leave the outboard motor in this position until all fuel has been drained.
7. When thoroughly drained, retighten the drain screw securely.
8. Check the drained fuel for the presence of water or other contaminants. If either is present, reassemble the outboard motor, refill the vapor separator with fuel, and then drain the fuel again. Repeat this procedure until no water or other contaminants are present in the drained fuel.

**Battery**

**WARNING**

- Place the battery away from any source of fire, sparks and open flames such as burners or welding equipment.
- Place the battery away from fuel tank. Accidental sparks of battery may cause explosion of gasoline.

1. Disconnect the battery cables and be sure to remove the negative terminal first.
2. Wipe off any chemical deposits, dirt, or grease.
3. Apply grease to the battery terminals.
4. Charge the battery completely before storing it for the winter.
5. Recharge the battery once a month to prevent it from discharging and the electrolyte from deteriorating.

6. Store the battery in a dry place.

4. Pre-season check

The following steps must be taken when first using the engine after off season storage.

1. Check that the shift and throttle function properly. (Be sure to turn the propeller shaft when checking the shift function or else the shift linkage may be damaged.)

2. Check the electrolyte level, and measure the voltage and specific gravity of the battery.

<td>12</td>
<td>3/4 charged</td>
</tr>
<tr>
<td>1.280</td>
<td>13.2</td>
<td>Fully charged</td>
</tr>
</tbody>
</table>

3. Check that the battery is secure and the battery cables are properly installed.

4. Change the engine oil (See page 68).

5. Before starting the engine, disconnect stop switch lock and crank approximately 10 pulling the recoil starter (Manual start model) or 3times of 3sec. turning the starter motor (Electric start model) in order to prime the oil pump.

6. Fill fuel tank completely.

7. Start the engine and warm up the engine for 3 minutes in the “NEUTRAL” position.

8. Run the engine for 5 minutes at the slowest speed.

9. Run the engine for 10 minutes at half throttle. The oil used for storage inside the engine will be circulated out to assure optimum performance.

5. Submerged outboard motor

Do not attempt to start submerged outboard motor immediately after it is recovered, or engine could be severely damaged.

After taking your outboard motor out of the water, immediately take it to your dealer. The following are the emergency measures to be taken for a submerged outboard motor, if you can not take it your dealer right away.

1. Wash the outboard motor with fresh water to remove salt or dirt.

2. Remove the engine oil drain screw and completely drain water and oil from the engine.

3. Remove the spark plugs, and completely drain the water from the engine by pulling recoil starter several times. Replace oil filter and oil to the correct level.

The oil and filter may need to be changed again after running a short period to get all moisture completely out of the crankcase.
4. Inject a sufficient amount of engine oil through the spark plug holes. Pull the recoil starter rope several times to circulate the oil throughout the outboard motor.

**6. Cold weather precautions**

If you moor your boat in cold weather at temperatures below 0°C (32°F), there is the danger of remained water freezing in the cooling water pump, which may damage the pump, impeller, etc. To avoid this problem, submerge the lower half of the outboard motor into the water.

**7. Striking underwater object**

**CAUTION**

Striking the sea bottom or an underwater object may severely damage the outboard motor.

Follow the procedure below and consult a dealer as soon as possible.
1. Stop the engine immediately.
2. Check the control system, gear case, boat transom etc.
3. Return to the nearest harbor slowly and carefully.
4. Consult a dealer check the outboard motor before operation again.

**8. Operation with multiple outboard motors**

When operating the outboard motors in reverse at more than the lowest speed, be sure that all engines are running. If any engine has stopped, be sure to tilt the outboard motor up and keep its propeller out of the water. Otherwise, water could enter the engine and cause damage to it.
If you encounter a problem, consult the check list below to determine the cause and to take the proper action.

An authorized dealer will always be happy to provide any assistance and information.

Use a genuine propeller.
A propeller must be selected so that the engine rpm measured at wide open throttle while cruising is within the recommended range.

25 : 5000–6000 rpm
30 : 5250–6250 rpm

EMISSION CONTROL SYSTEM INFORMATION

**ENOM01000-0**

*Emission Sources*

Carbon monoxide, oxides of nitrogen and hydrocarbons are produced in the course of the combustion process. Controlling production of oxides of nitrogen and hydrocarbons is very important because they react to form a photochemical smog under certain conditions when subjected to sunlight. Carbon monoxide does not react in the same way, but is a toxic byproduct.

**ENOM01001-0**

*Ignition Timing Control System*

To reduce the amount of HC, CO and NOx produced, the ignition timing control system continuously adjusts the ignition timing.

**ENOM01002-1**

*Fuel Injection system*

The Fuel Injection system relies on, multi-port fuel injection for both engine control and fuel control. The Engine Control Unit (ECU) has several sensors to determine how much fuel is needed for injection under all operating conditions.

**ENOM01003-0**

*Clean Air Acts of the United States and California, and Environment Canada*

EPA, California, and Canadian regulations require all manufacturers to provide written instructions that describe the operation and maintenance of commercial emission control systems.

The following instructions and procedures must be followed in order to keep the emissions from your engine within these emission standards.

**ENOM01004-0**

*Tampering and Modifications*

Tampering is a violation of the Federal Laws of the United States and California.

Tampering with or altering the emission control system could cause emissions to increase beyond legal limits. The following acts, although not all inclusive, are considered as tampering:

- Removing or modifying any part of the intake, fuel or exhaust system.
- Modifications that cause the engine to operate outside its design parameters.
If you notice any of the following symptoms, have your outboard motor inspected and repaired by an authorized Tohatsu service dealer before further use.

- Hard starting or stalling immediately after starting
- Rough idling
- Misfiring/backfiring under load
- Afterburning (backfiring)
- Black exhaust smoke or increased fuel consumption

The emission control system in your Tohatsu outboard motor has been designed, built, and certified to conform with the EPA and California emission regulations. Whenever requesting maintenance, use of Tohatsu Genuine parts is highly recommended. Tohatsu Genuine parts constitute replacement parts manufactured to the same high standards as the original parts, thus guaranteeing uninterrupted high performance of your outboard motor. The use of replacement parts other than Tohatsu Genuine parts could jeopardize the effectiveness of the emission control system.

Tohatsu, as a manufacturer of aftermarket parts, assumes the responsibility that replacement parts will not adversely affect emission performance. The manufacturer or rebuilder of the replacements parts must certify that use of the parts will not result in a failure of the engine to comply with these regulations.
EPA pressurized portable fuel tank requirements

EQUIPPED FOR UNITED STATES AND CANADA MODEL
The Environmental Protection Agency (EPA) required portable fuel systems that are produced after January 1, 2011 for use with outboard engines to remain fully sealed (pressurized) up to 34.4 kPa (5.0 psi). These tanks may contain the following:
- An air inlet that opens to allow air to enter as the fuel is drawn out of the tank.
- An air outlet that opens (vents) to the atmosphere if pressure exceeds 34.4 kPa (5.0 psi). A hissing noise may be heard as the tank vents to the atmosphere. This is normal.
- When installing the fuel tank cap, turn the cap to the right until you hear two clicks. This signals that the fuel cap is fully seated. A built-in device prevents overtightening.
- The fuel tank has a manual vent screw which should be closed for transportation and full open for operation and cap removal.

Since sealed fuel tanks are not openly vented, they will expand and contract as the fuel expands and contracts during heating and cooling cycles of the outside air. This is normal.

EPA approval Primer valve/hose assembly

EQUIPPED FOR UNITED STATES AND CANADA MODEL
TOHATSU adopts Primer bulb/hose assembly approved by the Environment Protection Agency (EPA).
Please use the EPA approved primer bulb/hose assembly with the identification mark on the fuel connector.

CAUTION

Be sure to use EPA approved tank and EPA approved primer bulb/hose assembly as a set. Confirm shapes of EPA approved tank and regular tank.

1. Except for U.S. model (regular tank)
2. For U.S. and Canada model (EPA approved tank)
Maintenance

Follow the maintenance schedule presented on page 70. Keep in mind that this schedule is based on the assumption that the outboard motor will only be used for its intended purpose. Operation under sustained high loads or other unusual conditions will require more frequent service.

Star label

This outboard motor is labeled with the California Air Resources Board (CARB) star label. A description of this label is presented below.

One Star-Low Emission
One Star-Low emission The one-star label identifies engines that meet the Air Resources Board’s Personal Watercraft and Outboard marine engine 2001 exhaust emission standards. Engines meeting these standards have 75% lower emissions than conventional carbureted two-stroke engines. These engines are equivalent to the U.S. EPA’s 2006 standards for marine engines.

Two Stars-Very Low Emission
The two-star label identifies engines that meet the Air Resources Board’s Personal Watercraft and Outboard marine engine 2004 exhaust emission standards. Engines meeting these standards have 20% lower emissions than One Star-Low Emission engines.

Three Stars-Ultra Low Emission
The three-star label identifies engines that meet the Air Resources Board’s Personal Watercraft and Outboard marine engine 2008 exhaust emission standards or the Sterndrive and Inboard marine engine 2003-2008 exhaust emission standards.
Engines meeting these standards have 65% lower emissions than One Star-Low Emission engines.

Four Stars-Super Ultra Low Emission
The four-star label identifies engines that meet the Air Resources Board’s Sterndrive and Inboard marine engine 2009 exhaust emission standards.
Personal Watercraft and Outboard marine engines may also comply with these standards.
Engines meeting these standards have 90% lower emissions than One Star-Low Emission engines.
